

Genética Populacional e Filogeografia

Salamandra-lusitânica

Chioglossa lusitanica

Adulto

Larva

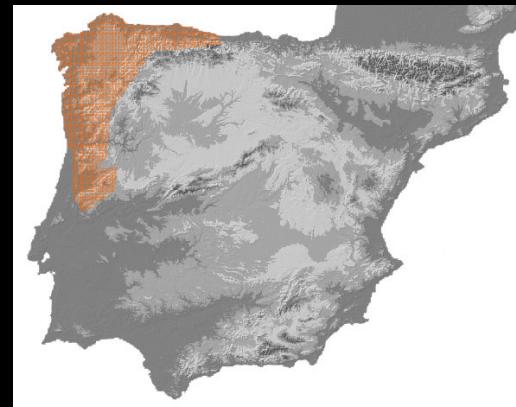

OVOS

***Chioglossa lusitanica*, uma salamandra peculiar**

- Endémica da Península Ibérica
- Único representante do género
Chioglossa

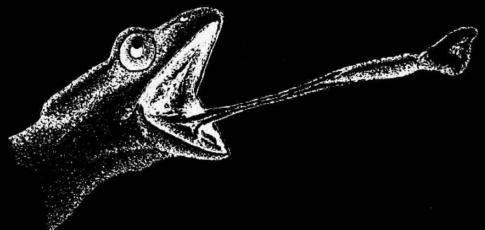

Mertensiella Caucasică

Chioglossa lusitanica

- Particularidades únicas

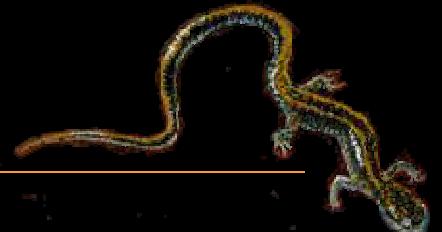

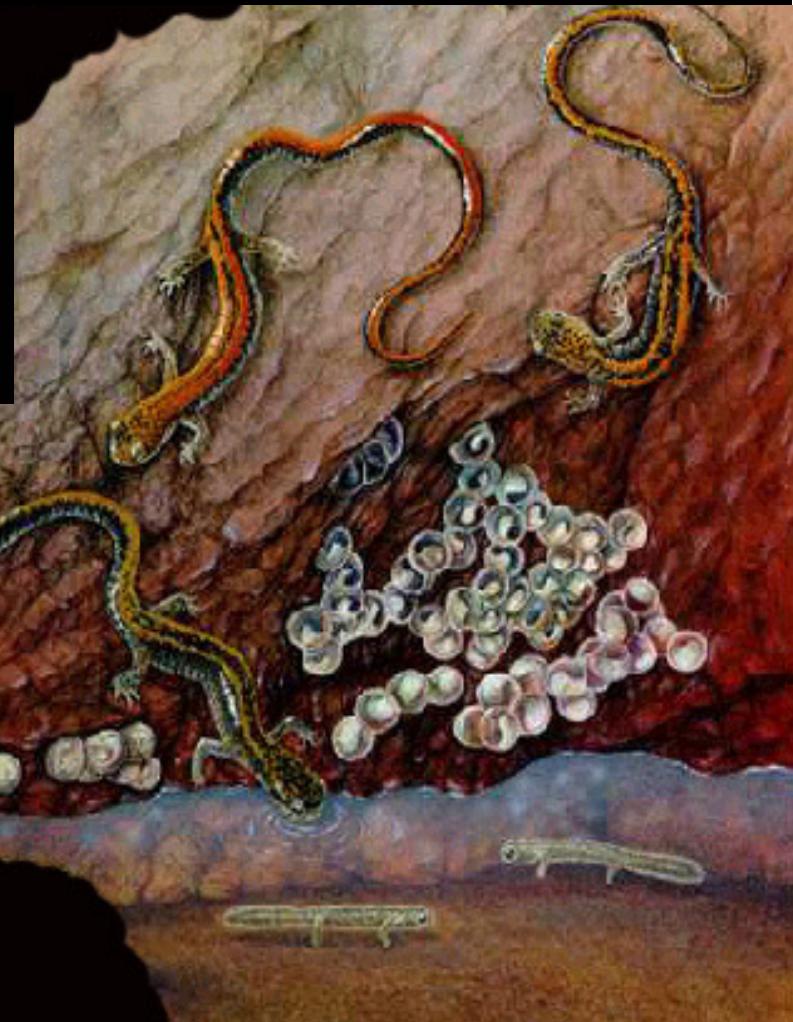

Língua preênsil com pedículo protráctil

Autotomia da cauda

Respiração essencialmente cutânea

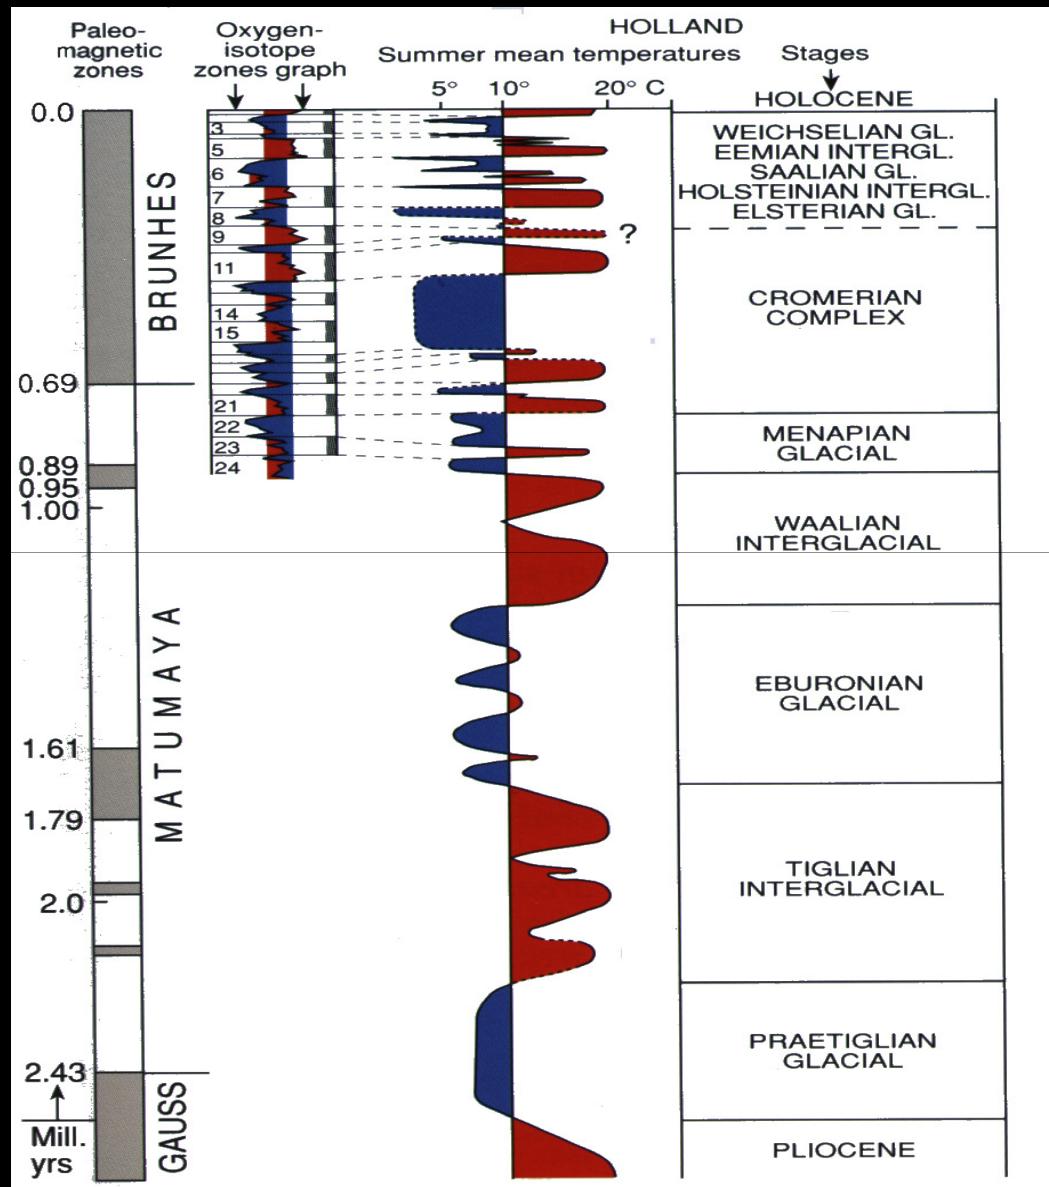

Habitat

- Dependente de habitats saturados em humidade
- Baixa capacidade de dispersão

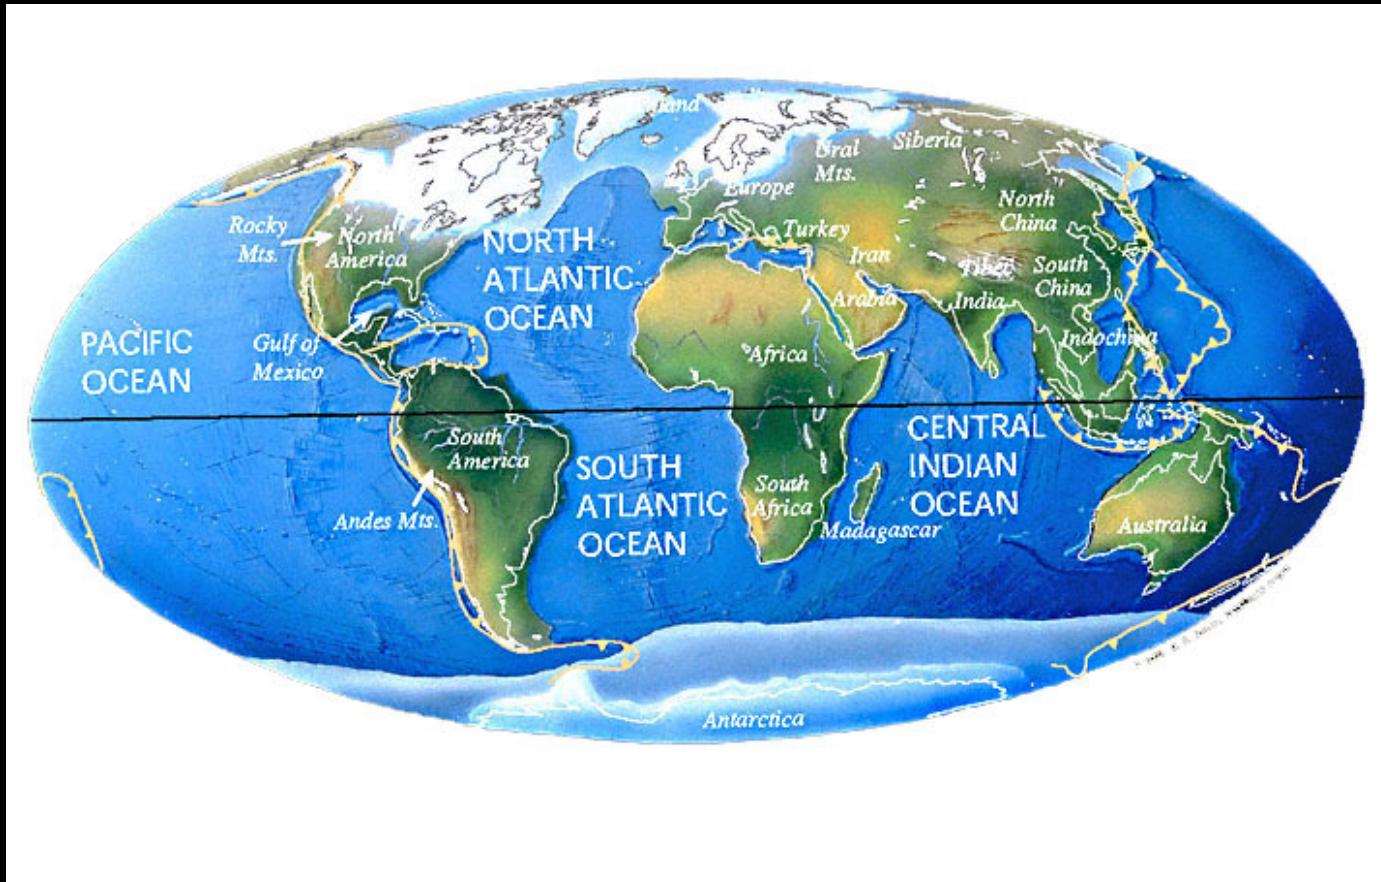

Condições climáticas durante o Quaternário

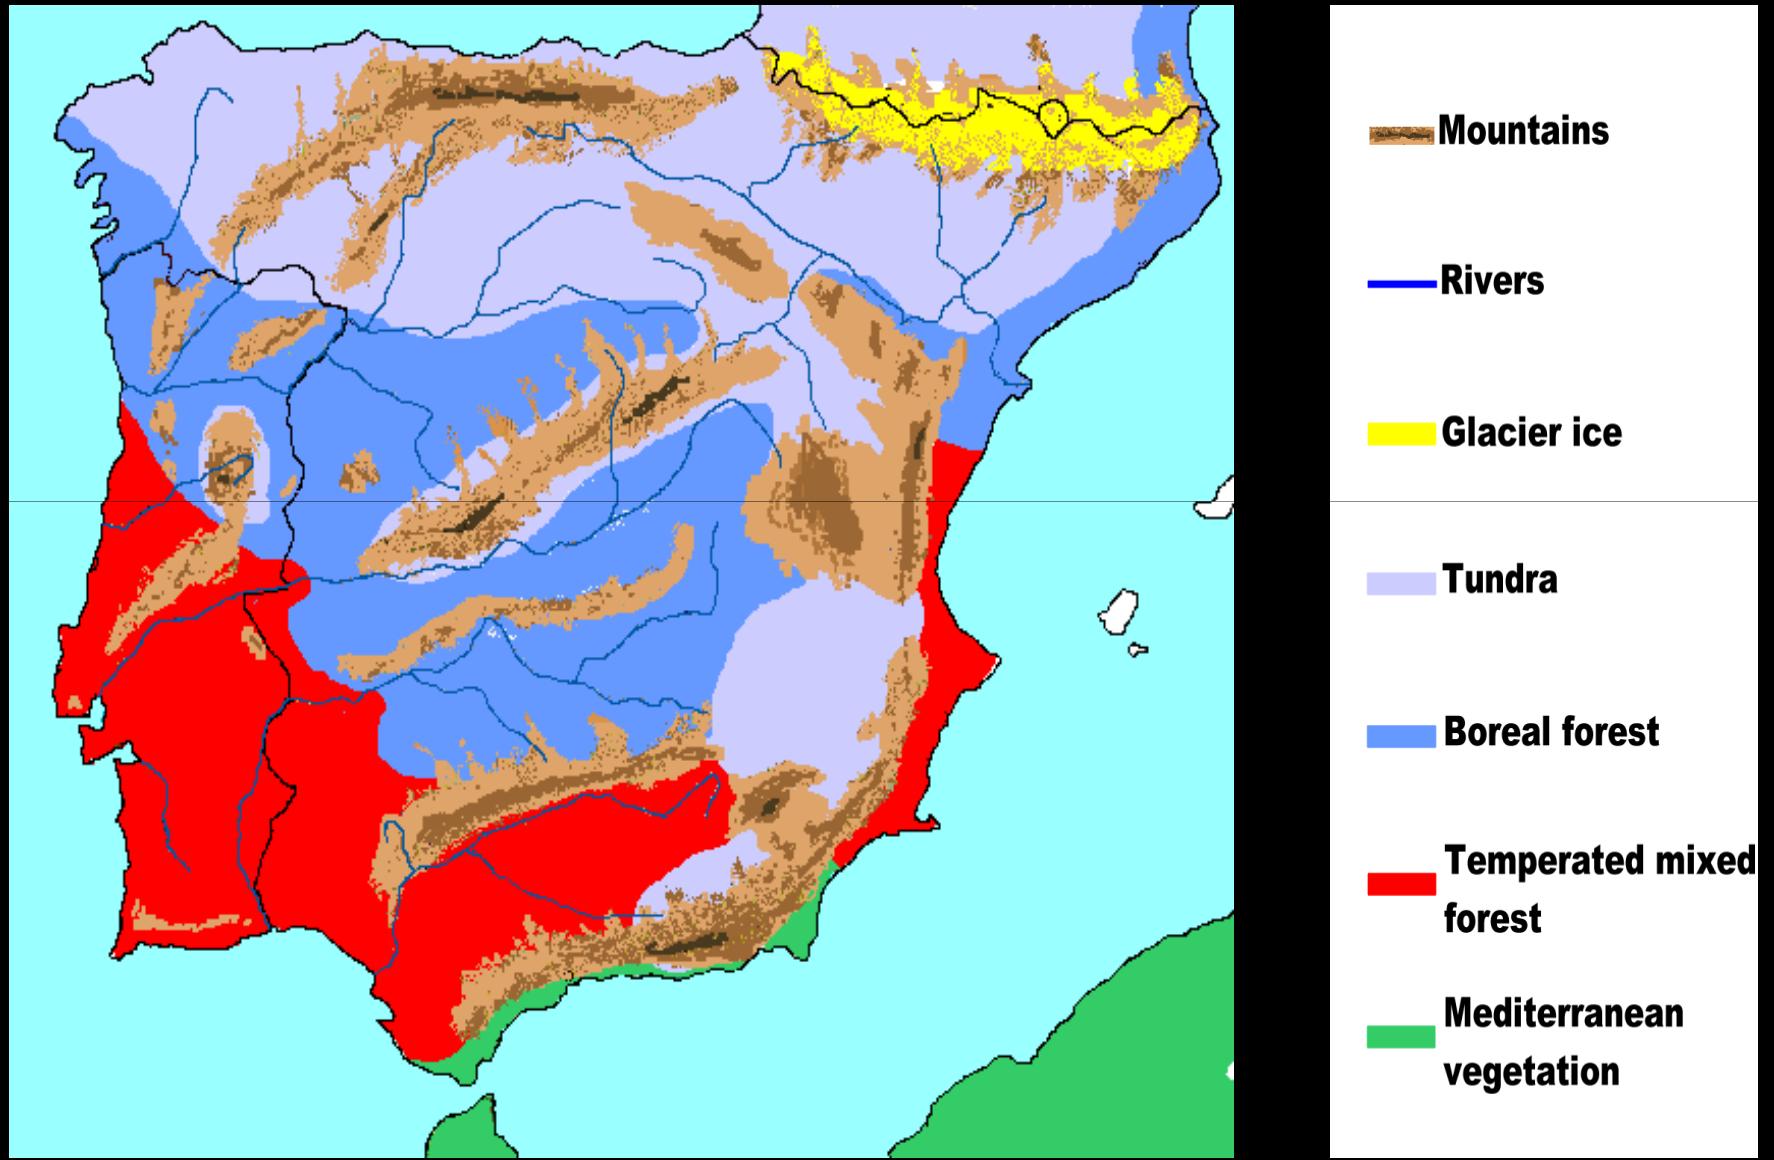

(Último Máximo Glaciar)

Durante os dois últimos milhões de anos o clima da Terra variou drasticamente, entre períodos glaciares e interglaciares

Península Ibérica há 18-20 milhares de anos

Amostragem

❖ Variabilidade genética

1. polimorfismos proteicos; 2. microssatélites; e, 3.DNA mitocondrial (Citocromo b)

❖ Distribuição da variabilidade genética nas populações amostradas

ex. Nº de alelos/haplótipos, diversidade haplotípica e nucleotídica, heterozigotia etc...

❖ Estrutura populacional

ex. Fst/Rst, árvores filogenéticas, métodos de agrupamentos Bayesianos, rede de haplótipos, mismatch, AMOVA

❖ Diferenciação/divergência e demografia

ex. distâncias genéticas, métodos de coalescência, efectivo populacional, expansão

❖ Interpretação com base na ecologia, barreiras geográficas (ex. rios, zonas de habitat) e factores climáticos

ANÁLISE ON-LINE

<http://cbsuapps.tc.cornell.edu/index.aspx>

(Computational Biology Service Unit Web Computing Resources)

<http://genepop.curtin.edu.au> *****genepop

The primary purpose of the original DOS based software is to compute exact tests for the following :

- Hardy-Weinberg equilibrium
- Population differentiation, and
- Genotypic disequilibrium among pairs of loci

The software computes estimates of classical population parameters, including:

- Allele Frequencies and other basic information,
- Fst and other correlations,
- Maximum likelihood estimates in the presence of a NULL allele,
- Nm estimates by the private allele method.

The package also has some ecumenical utilities which convert the input GENEPOP format files to formats used by other statistical packages such as LinkDos, FSTAT, MONTY, BIOSYS, and ANOVA file for heterozygosity.

Análise da diversidade genética (parâmetros standard)

- ❖ N^º de alelos/locus
- ❖ N^º médio de alelos/população
- ❖ Frequência alélica/população
- ❖ Riqueza alélica/população
- ❖ Heterozigotia observada
- ❖ Heterozigotia esperada
- ❖ HWE
- ❖ LD

Análise da diversidade genética

❖ GENETIX

❖ GENEPOP

❖ FSTAT

❖ ARLEQUIN

❖ GENALEX

GENETIX

❖ Construção do Infile – phylogenetix.xls –
transformar - phylogenetix.txt
(texto separado por tabulações, formato txt)

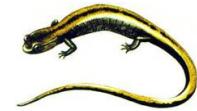

- ❖ Abrir o genetix
 - 1. fichier > importer (escolher o nosso ficheiro) > tabulation > 3 chiffres
 - 2. Seleccionar variabilité

Nº médio de alelos em cada população

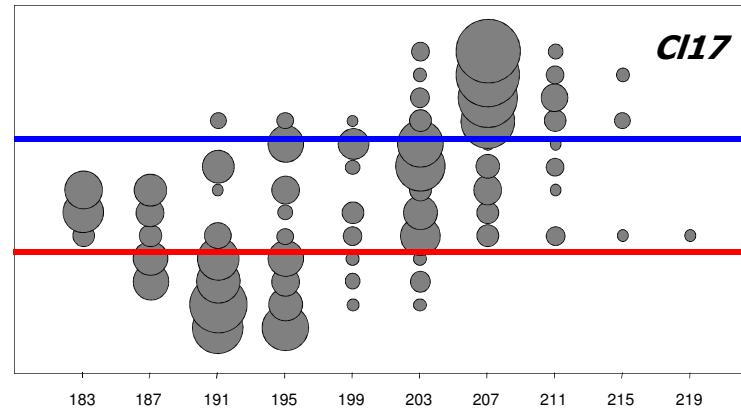

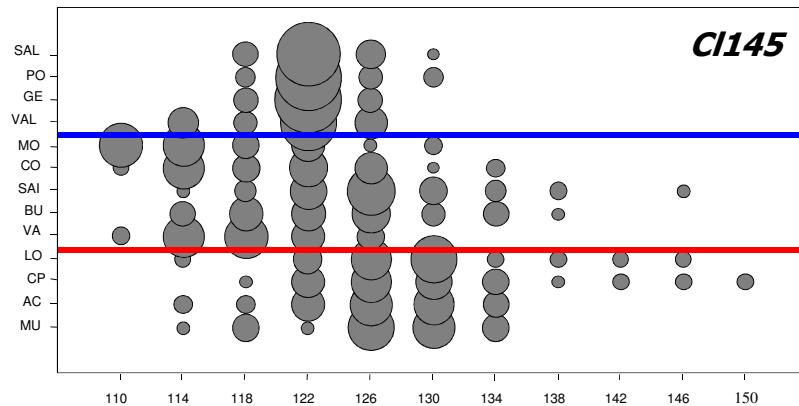

Heterozigotia esperada (He) em cada população

Variação da He com a latitude (construir gráfico – ver ficheiro DistHe.xls)
